A Additional Results and Case Studies

A.1 Case Reports

Figure 1 illustrates two cases: a high-risk true positive in whom both the time series and notes strongly indicate deterioration, and a low-risk true negative with stable trends and reassuring narrative. In the high-risk case, the LLM-backed consultation reinforces the local model’s elevated risk estimate and provides a rationale that emphasizes the same multimodal signals as the attention mechanism. In the low-risk case, the router does not trigger LLM consultation because the local model’s prediction is confident and well calibrated.

A.2 Detailed Architecture of Cardio-Hybrid Net
